                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     vectors, host cells and transgenic plants that are resistant to disease are also provided. The fusion protein is target-specific, and resists degradation in the insect gut. (Updated on 23-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              27-SEP-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                  Sequence 508 AA;

                                                                                                                                                                                                                                                                                                                     The present sequence is that of prawn (Penaeus japonicus) chitinase. This protein can be used in claimed fusion proteins of the invention comprising a translocating moiety and a toxic moiety, where the translocating moiety is a plant protein (e.g. a lectin) capable of acting as a carrier to translocate the toxic moiety across the gut wall of a plant pathogen, and the toxic moiety is an arthropod-derived peptide or protein capable of causing deleterious effects on growth, development, reproduction or mortality in pest insects. Suitable arthropod peptides and proteins include allatostatins, chitinase, diuretic hormone and their metabolites and analogues. Polynucleotides encoding the fusion protein, vectors, host cells and transgenic plants that are resistant to disease are also provided. The fusion protein is target-specific, and resists cdegradation in the insect gut. (Updated on 23-OCT-2003 to standardise OS field)

T "Complete genome sequence and comparative analysis of the industrial

IT microorganism Streptomyces avermitilis.";

Nat. Biotechnol. 21:526-531(2003).

I Nat. Biotechnol. 21:526-531(2003).

The glycine cleavage system catalyzes the degradation of

glycine. The protein binds the alpha-amino group of glycine

through its pyridoxal phosphate cofactor; CO(2) is released and

the remaining methylamine moiety is then transferred to the

lipoamide cofactor of the H protein (By similarity).

C -i-CAPALYTIC ACTIVITY: Glycine + lipoylprotein = S-

-i-CAPALYTIC ACTIVITY: Glycine + lipoylprotein = S-

-i-CAPALYTIC The glycine cleavage system is composed of four proteins:

C -i-SUBUNIT: The glycine cleavage system is composed of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

I. CATALYTIC ACTIVITY: ATP + L-tyrosine + tRNA(Tyr) = AMP +
diphosphate + L-tyrosyl-tRNA(Tyr).
I. SUBUNIT: Homodimer (By similarity).
I. SUBUNIT: Homodimer (By similarity).
I. SUBCELLULAR LOCATION: Cytoplasmic.
I. SUBCELLULAR LOCATION: Cytoplasmic.
I. SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
I. SIMILARITY: Contains 1 S4 RNA-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE OF 122-202 FROM N.A.

TISSUE SPECIFICITY: Expressed at high levels in lung, brain, intestine, muscle, heart and skin with lower levels found in kidney, liver, uterus, spleen and salivary gland.

DOMAIN: The N-terminus interacts with actin, the C-terminus vimentin, desmin, GFAP, cytokeratins, lamin B; whereas both and the C-terminus can bind integrin beta-4.

PIM: PHOSPHORYLATED BY CDC2; REGULATES DISSOCIATION FROM INTERMEDIATE FILMMENTS DURING MITOSIS (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SIMILARITY: Contains 1 actin-binding domain.
SIMILARITY: Contains 2 calponin-homology (CH) domains.
SIMILARITY: Contains 3 spectrin repeats.
SIMILARITY: Belongs to the plakin or cytolinker family.

SIMILARITY: Contains 2 calponin-homology (CH) domains.
SIMILARITY: Contains 32 plectin repeats.
SIMILARITY: Contains 4 spectrin repeats.
SIMILARITY: Belongs to the plakin or cytolinker family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                also in the regulation of their dynamics.
SUBUNIT: Homodimer or homotetramer.
DOMAIN: The N-terminus interacts with actin, the C-t vimentin, desmin, GFAP, cytokeratins, lamin B; where and the C-terminus can bind integrin beta-4.
PTM: PHOSPHORYLATED BY CDC2; REGULATES DISSOCIATION INTERMEDIATE FILAMENTS DURING MITOSIS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: Interlinks intermediate filaments with microtubules and microfilaments and anchors intermediate filaments to desmosomes of hemidesmosomes. May be involved not only in the crosslinking and stabilization of cytoskeletal intermediate filaments network, but
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CRIGR
